

Additional file 10: Figure S7. Anti-hSIRP α does not impair CD4+ or CD8+ T-cell proliferation. (A) Illustration of CD3+ T-cell blast formation after 3 days treatment with SEB and indicated antibodies (used at 666.7 nM). Blast formation results in an increase in FSC-A and SSC-A. (B) Measurement of CD4+ and CD8+ T-cell activation. Anti-CD47 decreases CD4+ T-cell blast formation whereas ADU-1805 has no effect. (A, B: Mean; $n = 3$ donors are shown as a representative of $n = 6$ donors). Data were analyzed by unpaired two-sided Student's t-test. * indicate statistical differences compared to the respective isotype control group: * $p < 0.05$; ns, not significant.
