

Supplementary Figure 1

Endogenous anti-MICA pAb in mice challenged with MB49-MICA tumors. Sera from mice challenged with MB49-MICA*008 cells (green) were analyzed by ELISA with rMICA-coated plates as described in Methods for the presence of anti-MICA pAb 12 days after tumor challenge. As control, sera from naïve mice were also analyzed (yellow). $n=3$ per group. Data shown correspond to one representative experiment which was performed twice with similar results.
