

Supplementary File 2: Figure S1. DC subset gating strategies pre and post SLN single-cell culture

Shown are the gating strategies of DC subsets (A) pre-culture and (B) post-culture. FSC/SSC viability gating was used to gate viable leukocytes, excluding dead cells, granulocytes and debris. The left columns show the gating strategy of the two migratory (CD1a+) conventional DC subsets: CD11c^{int}CD1a^{hi} (LC) and CD11c^{hi}CD1a^{int} (dDC). The right columns show the gating strategy of the two LNR DC subsets: the CD11c⁺CD14⁻ LNR conventional DC subset (LNR-cDC), pre-gated to exclude CD1a+ cells and the BDCA2⁺CD123⁺ plasmacytoid DC (pDC) subset.
