

Fig. S14: Design of the mice experiments.

- a.** 5×10^4 NALM-6 tumor cells were injected intravenously into NSG mice. Five days later, 2×10^6 CAR T cells were injected intravenously and bioluminescence imaging was performed every 7 days.
- b.** 5×10^5 SKOV3-CD19 tumor cells were injected subcutaneously into NSG mice. Seven days later, 5×10^6 CAR T cells were injected intravenously and bioluminescence imaging was performed every 7 days. The survival of the mice were monitored for 100 days.
