

Supplemental Figure 7. Phagocytosis of unopsonized CMP-001 has no impact on monocyte response to IFN α . Monocytes from healthy donors were treated with recombinant IFN α plus or minus CMP-001 for 18-20 hours. Impact on IDO, PDL1 and CXCL10 expression was determined by flow cytometry. Statistical significance was determined using paired T-test with alpha = 0.05 (ns = not significant; n = 7).
