Supplemental Figure 8. Phagocytosis of anti-Qβ-coated CMP-001 by monocytes has minimal impact on CXCL10 production in response to IFNα. Monocytes from healthy donors were treated with recombinant IFNα plus or minus anti-Qβ-coated CMP-001 for 24 hours. Impact on CXCL10 production was determined by ELISA. Statistical significance was determined using paired t-test with alpha 0.05 (ns = not significant; n = 4).
