**Figure S1c. Peripheral dynamics of T cell clonotypes that expanded between one week and 3-6 months post-SABR.** TCR Vβ CDR3 sequencing was performed on peripheral blood T cells at serial timepoints before, during, and after SABR for patients ci1424, ci1425, ci1426, and ci1437. Datapoints represent TCR Vβ clones that significantly expanded (Fisher’s exact test, p<0.05) after the one week post-SABR timepoint. The frequency of these expanded clones is shown at all timepoints sequenced within a given patient. Data are shown as the frequency of the clone among all peripheral blood T cells sequenced at that timepoint.
